

SFH shapes on fractional-age and accumulated dynamical-time coordinates

Same six median histories · 250 common u bins · linear vertical scales

Left: original mass density in fractional time. Middle: change the time axis only. Right: conserve bin mass, including the $1/H$ Jacobian.
Each row is selected from a different peak-time quantile; no uncertainty draws. Finite u cutoff; retained mass is not renormalized. $H_0=70$, $\Omega_m=0.3$.
