

Catalog SFR versus SFH-derived SFR Euclid bright explorer validation sample

9,719 galaxies plotted
3,998 zero-SFH-SFR objects omitted
Median $\log(\text{SFH} / \text{catalog}) = -0.60$ dex

SFH estimate: integrate the normalized median history over 0-100 Myr;
multiply by $M_{*,\text{catalog}}/(1 - 0.4)$. This mass-return conversion is an assumption.
Catalog SFR averaging window unverified; no PHZ quality cuts available.
