

Catalog SFR versus SFH-derived SFR Euclid bright explorer validation sample

9,180 positive-SFR galaxies (full sample)
4,537 zero-SFH-SFR objects omitted
Full-sample median $\log(\text{SFH} / \text{catalog}) = -0.87$ dex

From the rebinned SFHs: integrate the normalized median history over 0-50 Myr;
divide by 50 Myr and multiply by $M_{*, \text{obs}}$; $R = 0$ (no return correction).
Catalog SFR averaging window unverified; no PHZ quality cuts available.
