

Observed-epoch comparison: 9,719 galaxies in all panels; 3,998 zero-SFH rates omitted

SFH SFR = mass fraction in 0–100 Myr $\times$ observed stellar mass / 100 Myr; no return correction.

Speagle MS uses observed $M_\star$ and cosmic age(z), without reconstructing past mass. Statistics include values outside display limits.

No PHZ quality cuts; no IMF offset applied. SFH summary is the normalized median history.
